ChatGPT 5.2 Thinking a dit :

Tu as 2 soucis distincts dans ton log :

1. **Tu as bien commit tes vidéos, mais elles ne sont pas en LFS**
   On voit `36 files changed` et plein de `.mkv` “create mode 100644 …”. Ça veut dire que Git a mis les vidéos **dans le commit normal**, pas en pointeurs LFS (sinon tu verrais des fichiers “texte” LFS, et souvent `git lfs` te montre des objets LFS à pousser).

2. **Le push a échoué (HTTP 408) pendant un upload énorme (~820 MiB)**
   Le 408 = timeout côté serveur / réseau. Même si tu as une bonne connexion, GitHub peut couper si ça prend trop longtemps.

Étape A — Vérifier si tes vidéos sont vraiment en LFS

Dans le repo `PORTFOLIO-cv-MARIO-8` :

```
git lfs status
git lfs ls-files
```

- Si `git lfs ls-files` est **vide** → tes `.mkv` ne sont pas passés en LFS.
- Si ça liste tes `.mkv` → elles sont bien en LFS (mais ton push a juste timeout).

Étape B — Corriger si les vidéos ont été commit "normalement"

Le problème classique : tu as fait `git lfs track` **dans le repo parent**, pas dans le repo `PORTFOLIO-cv-MARIO-8`. Chaque repo a son propre `.gitattributes`.

1) Dans `PORTFOLIO-cv-MARIO-8`, re-track LFS

```
git lfs install
git lfs track "*.mp4" "*.mov" "*.mkv" "*.avi"
git add .gitattributes
git commit -m "Configure Git LFS for videos"
```

2) Migrer l'historique pour mettre les vidéos en LFS (important)

Comme tu as déjà un commit où les `.mkv` sont “normaux”, il faut réécrire l’historique :

```
git lfs migrate import --include="*.mp4,*.mov,*.mkv,*.avi"
```

Puis :

```
git status
git log --oneline --decorate -5
```

3) Forcer le push (car historique réécrit)

```
git push --force-with-lease
```

Ensuite pousser LFS (souvent c’est automatique, mais au besoin) :

```
git lfs push --all origin main
```

Étape C — Corriger le timeout HTTP 408 (même si LFS est OK)

Avant de re-push, augmente la tolérance côté Git :

```
git config --global http.postBuffer 524288000
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999
```

Puis retente :

```
git push -u origin main
```

Étape D — Ton warning “embedded git repository”

Ça vient de ça : tu as fait `git init` dans `github19`, puis tu as `git clone` dedans, puis tu as fait `git add *` au niveau parent.
👉 Conclusion : **ne versionne pas le repo parent** si tu ne veux pas faire de sous-module.

Pour nettoyer le parent (si tu veux juste garder `PORTFOLIO-cv-MARIO-8` comme seul repo) :

Depuis `D:/PYTHON DJANGO HOPES/github19` :

```
git rm --cached -r PORTFOLIO-cv-MARIO-8
rm -rf .git
```

(Le `rm -rf .git` supprime le repo parent : ça évite toute confusion. Ton vrai repo reste `PORTFOLIO-cv-MARIO-8`.)

Le chemin le plus sûr (recommandé)

1. Reste **uniquement** dans `PORTFOLIO-cv-MARIO-8`
2. Assure-toi que `.gitattributes` est bien dedans et que `git lfs ls-files` liste tes vidéos
3. `git lfs migrate import …` si elles ont été commit sans LFS
4. `git push --force-with-lease` + éventuellement `git lfs push --all origin main`

Si tu colles ici la sortie de :

```
cd PORTFOLIO-cv-MARIO-8
git lfs ls-files
git remote -v
git status
```

je te dis exactement quelle branche/push faire et si la migration LFS est nécessaire ou pas.

ChatGPT a dit :

OK, ta sortie confirme le diagnostic : `git lfs ls-files` **ne liste rien** → tes `.mkv` **ne sont PAS en Git LFS**.
Du coup Git essaie d'envoyer **820 Mo en "pack" normal**, et ça time-out (HTTP 408).

On va faire la correction propre, dans **le bon repo** (`PORTFOLIO-cv-MARIO-8`) : ajouter `.gitattributes` dedans + migrer l'historique vers LFS + push forcé.

---

1) Dans `PORTFOLIO-cv-MARIO-8`, activer LFS + tracker les vidéos

```
cd "/d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8"

git lfs install
git lfs track "*.mp4" "*.mov" "*.mkv" "*.avi"

git add .gitattributes
git commit -m "Track videos with Git LFS"
```

---

2) Migrer le commit existant pour mettre les .mkv en LFS

⚠ Ceci réécrit l'historique local (normal ici, tu n'as pas réussi à pousser).

```
git lfs migrate import --include="*.mp4,*.mov,*.mkv,*.avi"
```

---

3) Vérifier que LFS a bien pris

```
git lfs ls-files
```

Tu dois maintenant voir tes fichiers `.mkv` listés.

---

4) Réparer le push (timeout) + pousser

Augmente la tolérance réseau Git, puis push forcé (car migration = réécriture) :

```
git config --global http.postBuffer 524288000
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git push --force-with-lease origin main
```

Si jamais Git pousse le code mais pas les objets LFS (rare), fais :

```
git lfs push --all origin main
```

---

5) IMPORTANT : ne fais plus `git init` dans le dossier parent

Ton dossier `github19` n'a pas besoin d'être un repo. Sinon tu retombes sur le warning "embedded git repository".

Si tu veux nettoyer le parent :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

Si ça échoue encore (408)

Change de protocole en SSH (beaucoup plus stable pour les gros push) :

```
git remote -v
git remote set-url origin git@github.com:Mariogit20/PORTFOLIO-cv-MARIO-8.git
git push --force-with-lease origin main
```

Si tu colles la sortie de **ces 3 commandes après l'étape 2** :

```
git lfs ls-files
git log --oneline -3
git remote -v
```

je te dis exactement si tout est OK et quelle commande finale lancer selon ton remote.

All uncommitted changes will be lost! [y/N]

ChatGPT a dit :

Tu es au bon endroit 👍
Le message **“override changes in your working copy?”** apparaît parce que `git lfs migrate import` va **réécrire l’historique** et Git veut être sûr que tu acceptes de “perdre” l’état actuel du working tree (en pratique, il va le recalculer après réécriture).

✅ Fais ceci maintenant

Tape `y` puis Entrée.

Ensuite enchaîne **immédiatement** avec ces commandes (dans `PORTFOLIO-cv-MARIO-8`) :

```
git lfs ls-files
git status
```

- `git lfs ls-files` doit afficher tes `.mkv` (sinon la migration n’a pas pris).
- `git status` doit être clean (ou presque).

Push après migration (obligatoire en force)

Comme l’historique a été réécrit, il faut pousser en force :

```
git config --global http.postBuffer 524288000
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git push --force-with-lease origin main
```

Et si Git LFS ne pousse pas automatiquement les objets (rare mais possible) :

```
git lfs push --all origin main
```

Si tu revois encore HTTP 408

Passe en SSH (beaucoup plus stable pour les gros uploads) :

```
git remote set-url origin git@github.com:Mariogit20/PORTFOLIO-cv-MARIO-8.git
git push --force-with-lease origin main
```

Si tu colles la sortie de `git lfs ls-files` juste après le `y`, je te confirme que les vidéos sont bien en LFS avant le push.

(use "git push" to publish your local commits) nothing to commit, working tree clean AzureAD+SPSSE02MEN@DESKTOP-S95K8U0 MINGW64 /d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8 (main) $

ChatGPT a dit :

Parfait ✅ : maintenant **tes 36 fichiers** `.mkv` **sont bien en Git LFS** (on les voit dans `git lfs ls-files`) et ton `working tree` est clean. Ton repo local est **en avance de 2 commits** sur `origin/main`, donc il ne reste plus qu'à pousser.

1) Push (avec historique réécrit → force)

Lance :

```
git config --global http.postBuffer 524288000
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git push --force-with-lease origin main
```

2) Si GitHub ne reçoit pas les objets LFS (au cas où)

```
git lfs push --all origin main
```

3) Si tu retombes sur HTTP 408

Passe en **SSH** (souvent beaucoup plus stable pour les gros transferts) :

```
git remote set-url origin git@github.com:Mariogit20/PORTFOLIO-cv-MARIO-8.git
git push --force-with-lease origin main
```

Si tu n'as pas encore de clé SSH sur GitHub : dis-moi et je te donne les commandes exactes `ssh-keygen` + ajout sur GitHub.

Petit ménage (optionnel mais conseillé)

Ton dossier parent `github19` ne doit pas être un repo (ça crée le warning "embedded repo").
Dans `D:/PYTHON DJANGO HOPES/github19` :

```
rm -rf .git
```

Quand tu as fait le push, colle juste la sortie de :

```
git push --force-with-lease origin main
```

(et si ça échoue, le message exact), et je te guide au prochain pas.

(use "git push" to publish your local commits) nothing to commit, working tree clean AzureAD+SPSSE02MEN@DESKTOP-S95K8U0 MINGW64 /d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8 (main) $ git config --global http.postBuffer 524288000 git config --global http.lowSpeedLimit 0 git config --global http.lowSpeedTime 999999 git push --force-with-lease origin main Uploading LFS objects: 0% (0/36), 12 MB | 65 KB/s

ChatGPT a dit :

Nickel ✅ — là tu es **sur la bonne voie** : on voit clairement **“Uploading LFS objects … (0/36)”**. Ça veut dire que maintenant Git pousse **les vidéos via LFS**, et plus comme un gros pack Git (donc tu as corrigé le vrai problème).

Par contre, ton débit affiché **65 KB/s** est très faible, donc tu risques encore un timeout si ça reste comme ça. Voilà les actions les plus efficaces **tout de suite**, sans tout casser.

---

1) Laisse ce push finir (si ça avance)

Tant que le compteur passe à 1/36, 2/36… c’est bon.

Si ça reste bloqué longtemps à 0% ou si ça retombe en 408, passe à l’étape 2.

---

2) Si ça échoue / 408 : pousse les LFS en “petits morceaux”

Annule le push (Ctrl+C), puis fais :

```
git config --global lfs.concurrenttransfers 1
git config --global lfs.activitytimeout 600
git config --global lfs.tlstimeout 600

git lfs push --all origin main
git push --force-with-lease origin main
```

- `concurrenttransfers 1` = 1 fichier à la fois → souvent plus stable sur connexions lentes.

3) Option “béton” : basculer en SSH

⚠ Même avec SSH, **LFS passe toujours en HTTPS**, mais Git “normal” devient plus stable, et parfois ça évite des soucis réseau globaux.

```
git remote set-url origin git@github.com:Mariogit20/PORTFOLIO-cv-MARIO-8.git
git push --force-with-lease origin main
```

Si tu n’as pas encore de clé SSH GitHub :

```
ssh-keygen -t ed25519 -C "mariomariochatgpt@gmail.com"
eval "$(ssh-agent -s)"
ssh-add ~/.ssh/id_ed25519
cat ~/.ssh/id_ed25519.pub
```

Tu copies la clé publique dans GitHub → Settings → SSH and GPG keys → New SSH key.

---

4) Vérifier à la fin que tout est OK

Quand ça finit, fais :

```
git status
git lfs status
git lfs ls-files | wc -l
```

Tu dois avoir :

- working tree clean
- `Objects to be pushed` vide
- `wc -l` = **36**

Important (pour éviter de refaire l'erreur)

Ne refais plus `git init` dans `github19` (le dossier parent). Travaille seulement dans `PORTFOLIO-cv-MARIO-8`.

Si tu peux, colle la **ligne finale** quand ça se termine (ou le message d'erreur si ça coupe). Je te dirai exactement la commande suivante selon ce qui arrive.

Vous avez dit :
Si ça reste bloqué longtemps à 0% ou si ça retombe en 408, passe à l'étape 2.

ChatGPT a dit :

Oui — et tu peux le décider avec une règle simple.

Quand considérer que c'est "bloqué"

Sur ton écran tu vois un truc du style :

```
Uploading LFS objects: 0% (0/36), 12 MB | 65 KB/s
```

Passe à l'étape 2 si **l'un de ces cas arrive** :

- ça reste à **(0/36)** pendant ~5–10 minutes **sans changer**
- le nombre **0/36** ne bouge pas (même si le débit affiche quelque chose)
- tu récupères encore : `RPC failed; HTTP 408` (ou disconnect)

Étape 2 (à faire dans ce cas)

1. **Stoppe le push** : `Ctrl + C`
2. Puis exécute :

```
git config --global lfs.concurrenttransfers 1
git config --global lfs.activitytimeout 600
git config --global lfs.tlstimeout 600

git lfs push --all origin main
git push --force-with-lease origin main
```

Si ça bloque encore

Tu peux descendre encore plus "safe" :

```
git config --global lfs.concurrenttransfers 1
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999
```

Et relance `git lfs push --all origin main`.

Colle-moi juste la prochaine sortie (après Ctrl+C ou après erreur 408), et je te dis exactement quoi faire selon le message.

ChatGPT a dit :

Excellent — là on a enfin un signal clair ✅ : `3% (1/36)` veut dire que ta config “1 transfert à la fois” marche, et que ça **avance** (même si c’est lent).

Ce que tu dois faire maintenant

1. **Ne coupe plus** (évite `Ctrl+C`) tant que le compteur progresse : 1/36 → 2/36 → …
2. Laisse `git lfs push --all origin main` aller jusqu’à **100% (36/36)**.

Quand c’est fini, fais **ensuite** :

```
git push --force-with-lease origin main
```

Si ça re-bloque ou retombe en 408 malgré tout

Tu peux encore améliorer la stabilité :

A) Mettre les timeouts encore plus hauts

```
git config --global lfs.activitytimeout 3600
git config --global lfs.tlstimeout 3600
```

B) Désactiver HTTP/2 (ça règle pas mal de soucis “RPC failed” sur certains réseaux)

```
git config --global http.version HTTP/1.1
```

Puis relancer :

```
git lfs push --all origin main
```

Important (pour éviter confusion)

Tu n'as **plus besoin** de refaire `git init` / `git clone` à chaque fois.
Reste juste dans :
`/d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8`

Quand tu arrives à `100% (36/36)`, colle la sortie finale, et je te dis le check final (`git lfs status`, etc.) pour confirmer que GitHub a bien tout reçu.

Vous avez dit :

ChatGPT a dit :

YES ✅✅✅ — le plus dur est fait : `Uploading LFS objects: 100% (36/36), 889 MB … done.`
Donc **toutes tes vidéos sont bien envoyées sur GitHub via Git LFS**.

Maintenant il reste une dernière étape : **pousser les commits Git (les pointeurs LFS + .gitattributes)**.

1) Push final des commits

Toujours dans `.../PORTFOLIO-cv-MARIO-8` :

```
git push --force-with-lease origin main
```

2) Vérification

```
git lfs status
git status
```

Tu dois voir :

- `git lfs status` : rien à pousser
- `git status` : “Your branch is up to date with 'origin/main'” + working tree clean

---

Le message d’erreur “dial tcp: lookup github.com: no such host”

Ça c’est un **problème DNS / connexion** (ton PC n’arrivait plus à résoudre `github.com` pendant un moment). Comme tu as réussi à finir à 100%, c’est revenu. Si ça réapparait, la solution c’est souvent : changer de réseau / redémarrer la connexion / vérifier proxy/VPN.

Important : arrête de refaire `git init` et `git clone`

Tu as pollué ton terminal en copiant/collant des blocs complets (d’où les `bash: command not found`).
À partir de maintenant : **tu restes juste dans le repo** et tu fais uniquement les commandes nécessaires.

Colle-moi la sortie de `git push --force-with-lease origin main` (celle de maintenant) et je te confirme que le repo GitHub est 100% OK.

Vous avez dit :

ChatGPT a dit :

C'est **100% OK** ✅🎉

Tu as maintenant :

- **LFS objects upload : 100% (36/36)** ✅
- **Push Git réussi** : `main -> main` (de `137be81` vers `ca5237d`) ✅
- **git status** : *"Your branch is up to date with 'origin/main'" + working tree clean* ✅
- **git lfs status** : rien à pousser ✅

Donc ton repo GitHub contient bien les **pointeurs LFS + .gitattributes**, et les **889 MB** de vidéos sont bien sur Git LFS.

À faire pour éviter de te compliquer la vie (important)

1. **Arrête de faire `git init` dans le dossier parent `github19`**
   Ça te crée le warning “embedded repository”.
2. Garde juste le repo :
   `.../github19/PORTFOLIO-cv-MARIO-8`

Option nettoyage (facultatif mais recommandé) :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

Vérification rapide sur GitHub (optionnel)

Dans le repo GitHub, tu dois voir les `.mkv` avec l’icône/mention LFS (ou “Stored with Git LFS”).

Si tu veux, je peux aussi te donner la commande pour vérifier la taille “réelle” du repo vs LFS en local.

ChatGPT a dit :

OK — là tu es reparti pour **ajouter 4 nouvelles vidéos** (dossier **VIDEO PORTFOLIO 4seg**) et ton `git push` montre bien **LFS (0/4)** ✅. Donc c'est le bon mécanisme.

1) Très important : tu as commit ces 4 `.mkv` *sans* les mettre en LFS

La preuve : ton commit dit `4 files changed, 12 insertions(+)` et `create mode 100644 ... .mkv` (ça ressemble à des fichiers "normaux").
En LFS, un fichier vidéo dans Git devient un **petit pointeur texte**, donc tu ne devrais pas avoir un commit "classique" qui embarque les gros binaires.

👉 Il faut **migrer ces 4 fichiers vers LFS** (comme on a fait pour les 36), sinon tu vas retomber dans des problèmes (push énorme / 408).

Ce que tu fais maintenant (dans le repo racine, pas dans le sous-dossier)

1. **Annule le push** si tu veux (Ctrl+C) — mais si ça avance, tu peux aussi le laisser finir.
   Ensuite, reviens à la racine du repo :

```
cd "/d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8"
```

2. Vérifie que LFS track toujours `.mkv` :

```
git lfs track
```

Tu dois voir `*.mkv` listé.

3. **Migre l'historique** (ça va convertir aussi ces 4 nouveaux mkv en LFS) :

```
git lfs migrate import --include="*.mkv,*.mp4,*.mov,*.avi"
```

S'il demande "override changes…", réponds `y`.

4. Vérifie :

```
git lfs ls-files | tail
git status
```

Tu dois voir tes 4 nouveaux fichiers dans `git lfs ls-files`.

5. **Pousse (force)**
   Parce que `migrate` réécrit l'historique :

```
git config --global lfs.concurrenttransfers 1
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git lfs push --all origin main
git push --force-with-lease origin main
```

---

2) À propos du warning "embedded git repository"

Tu le revois parce que tu as encore un **repo parent** (`github19/.git`) et tu manipules un repo à l'intérieur.
Solution simple : supprime le `.git` du parent (ça ne touche pas `PORTFOLIO-cv-MARIO-8/.git`) :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

---

3) Petit rappel (évite les erreurs)

- **Ne fais pas** `cd "VIDEO PORTFOLIO 4seg"` pour commit/push.
  Reste à la **racine du repo** et ajoute le dossier :
  `git add "VIDEO PORTFOLIO 4seg/"`

Si tu colles la sortie de :

```
cd "/d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8"
git lfs ls-files | tail -n 10
git log --oneline -3
```

je te confirme que les 4 vidéos sont bien passées en LFS avant le push final.

ChatGPT a dit :

Parfait : `git lfs track` confirme que `*.mkv` **est bien tracké dans le bon** `.gitattributes` ✅

Maintenant il faut corriger le point clé : tes 4 nouvelles vidéos ont été **commitées comme des fichiers normaux**, donc on doit **migrer** (réécrire) ce commit "second commit" pour que ces `.mkv` deviennent des pointeurs LFS.

Étape 1 — Migrer le repo (inclut le "second commit")

Dans la racine `PORTFOLIO-cv-MARIO-8` :

```
git lfs migrate import --include="*.mkv,*.mp4,*.mov,*.avi"
```

S'il te demande `override changes...`, réponds `y`.

Étape 2 — Vérifier que les 4 nouveaux fichiers sont bien en LFS

```
git lfs ls-files | tail -n 10
git status
```

Tu dois voir des entrées qui commencent par un hash + `VIDEO PORTFOLIO 4seg/...seg1.mkv` etc.

Étape 3 — Pousser (LFS puis Git)

Comme l'historique a été réécrit : push en force.

```
git config --global lfs.concurrenttransfers 1
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git lfs push --all origin main
git push --force-with-lease origin main
```

IMPORTANT (sinon tu refais les mêmes soucis)

- Ne refais plus `git init` / `git clone` à chaque fois.
- Ne fais pas `git add *` (ça ignore les fichiers/dossiers cachés et ça peut faire des surprises). Utilise `git add .` **à la racine du repo**.

Si tu colles la sortie de `git lfs migrate import ...` + ensuite `git lfs ls-files | tail -n 10`, je te confirme que tes 4 vidéos sont converties correctement avant le push.

Vous avez dit :

ChatGPT a dit :

Top — tu as lancé la migration ✅

Mais **attention à un détail important** : la sortie dit :

`88d58a5... -> 88d58a5...` (le hash ne change pas)

➡️ Ça veut dire que **la migration n'a pas modifié le commit** (donc tes 4 `.mkv` sont probablement encore "normaux" dans Git, pas en pointeurs LFS). Ça arrive si Git LFS pense qu'ils sont déjà corrects, ou si rien n'a été "capturé" par la migration.

On va vérifier tout de suite, puis corriger à coup sûr.

---

1) Vérifie si tes 4 nouveaux .mkv sont bien en LFS

Toujours à la racine du repo :

```
git lfs ls-files | grep "VIDEO PORTFOLIO 4seg" || echo "PAS EN LFS"
```

- Si tu vois les 4 fichiers listés → OK, tu peux pousser.
- Si tu vois `PAS EN LFS` → ils ne sont pas convertis, on doit forcer.

Vérif encore plus "béton"

```
git show --stat --oneline -1
```

Si tu vois `4 files changed, 12 insertions(+)` encore, c'est **qu'ils ne sont pas en LFS** (car un pointeur LFS est un petit fichier texte, tu verrais plutôt des changements très petits, mais surtout pas une "création binaire" classique).

---

2) Si PAS EN LFS : force la conversion des 4 fichiers

Le plus simple et fiable :

```
git lfs migrate import --include="VIDEO PORTFOLIO 4seg/*.mkv"
```

Puis re-vérifie :

```
git lfs ls-files | grep "VIDEO PORTFOLIO 4seg"
```

---

3) Push (comme d'hab)

```
git config --global lfs.concurrenttransfers 1
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git lfs push --all origin main
git push origin main
```

⚠ Si la migration a finalement réécrit un commit (hash différent), fais plutôt :

```
git push --force-with-lease origin main
```

---

4) Pourquoi tu as le warning “embedded git repository”

Parce que tu continues à faire `git init` dans `github19`.
Le bon usage : **ne touche plus au repo parent**.

Nettoyage recommandé (ça ne casse pas ton repo portfolio) :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

Fais la commande de vérif (celle avec `grep "VIDEO PORTFOLIO 4seg"`) et colle la sortie : je te dis immédiatement si tu peux pousser ou si on doit forcer la migration.

ChatGPT a dit :

Parfait ✅✅✅ — là c'est **confirmé** : tes 4 fichiers sont **bien en Git LFS** (ils apparaissent dans `git lfs ls-files` avec `VIDEO PORTFOLIO 4seg/...`).

Il ne reste plus qu'à **pousser** (LFS puis commit Git).

1) Pousser les objets LFS

```
git config --global lfs.concurrenttransfers 1
git config --global http.lowSpeedLimit 0
git config --global http.lowSpeedTime 999999

git lfs push --all origin main
```

2) Pousser le commit (probablement en force)

Comme tu as fait `lfs migrate`, il y a de grandes chances que tu doives forcer :

```
git push --force-with-lease origin main
```

3) Vérifier que tout est clean

```
git lfs status
git status
```

Important pour la suite (ça t'évitera 90% des soucis)

- **Ne fais plus** `git init` **/** `git clone` à chaque fois.
- Travaille uniquement dans le repo `PORTFOLIO-cv-MARIO-8`.
- Le warning "embedded git repository" vient du `.git` dans le dossier parent `github19`. Tu peux le supprimer :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

Quand tu as fait le push, colle la sortie de `git push --force-with-lease origin main` et je te confirme que GitHub est à jour avec ces 4 vidéos.

ChatGPT a dit :

Parfait — là c'est exactement ce qu'on veut ✅
Tu es en train de pousser **les nouveaux objets LFS** : on voit **40 objets** au total (les 36 anciens + les 4 nouveaux), et tu es déjà à **90% (36/40)**.

Ce que tu dois faire maintenant

- **Ne coupe plus** (`Ctrl+C`) tant que ça avance.
- Laisse `git lfs push --all origin main` aller jusqu'à **100% (40/40)**.

Ensuite, fais **le push Git** (des commits/pointeurs) :

```
git push --force-with-lease origin main
```

Puis vérifie :

```
git lfs status
git status
```

Tu dois obtenir : rien à pousser + branch up to date.

Si ça retombe sur “no such host” / DNS

Tu avais eu `dial tcp: lookup github.com: no such host` avant : c’est un souci réseau/DNS intermittent.
Si ça revient :

1. relance **exactement** la même commande (elle reprend) :

```
git lfs push --all origin main
```

2. garde `lfs.concurrenttransfers 1` (tu l’as déjà, c’est bien)

Important (à retenir pour tes prochains ajouts)

- Ajoute/commit **depuis la racine** du repo (pas dans le sous-dossier).
- Ne refais plus `git init`/`git clone` dans `github19`.

Quand tu vois **100% (40/40)**, colle-moi la ligne finale, et je te donne la commande de push Git adaptée (force ou pas) selon ton état exact.

ChatGPT a dit :

Génial ✅✅✅
Tu as maintenant :

```
Uploading LFS objects: 100% (40/40), 1.8 GB ... done.
```

Donc les 4 nouvelles vidéos sont **bien envoyées sur GitHub LFS**.

Étape finale : pousser les commits Git

Maintenant exécute :

```
git push --force-with-lease origin main
```

Puis vérifie :

```
git lfs status
git status
```

Tu dois voir “nothing to commit” et “up to date”.

Important (pour ne plus te retrouver dans ce loop)

Tu refais `git init` / `git clone` en boucle : ça te crée le warning *embedded repo* et te fait perdre du temps.

🔲 Nettoyage conseillé du repo **parent** (ça ne touche pas ton portfolio) :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

Ensuite, tu travailles seulement dans :
`/d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8`

Colle-moi la sortie de `git push --force-with-lease origin main` juste après, et je te confirme que tout est bien en ligne (pointeurs + LFS).

ChatGPT a dit :

C'est parfait ✅✅✅

Tu as bien fait les 2 étapes :

- **LFS** : `Uploading LFS objects: 100% (40/40) ... done.` puis lors du push final `100% (4/4) ... done.` ✅
- **Git push** : `ca5237d..88d58a5 main -> main` ✅
- **Statut clean** : `Your branch is up to date with 'origin/main'` + `nothing to commit` ✅

Donc maintenant GitHub a :

- les **pointeurs LFS + .gitattributes**
- les **4 nouvelles vidéos** dans `VIDEO PORTFOLIO 4seg`
- et tout est synchronisé.

Dernier nettoyage (vraiment conseillé)

Tu continues à faire `git init` dans le dossier parent `github19`, ce qui provoque le warning "embedded repository" et te perturbe.

Exécute **une seule fois** :

```
cd "/d/PYTHON DJANGO HOPES/github19"
rm -rf .git
```

Ensuite, tu travailles uniquement ici :

```
cd "/d/PYTHON DJANGO HOPES/github19/PORTFOLIO-cv-MARIO-8"
```

Routine simple pour tes prochains ajouts vidéo

Toujours à la racine du repo :

```
git add .
git commit -m "add new videos"
git lfs push --all origin main
git push origin main
```

(Si tu utilises encore `git lfs migrate`, alors `git push --force-with-lease`.)

Si tu veux, je peux aussi te donner une commande “check rapide” pour confirmer que toutes les `.mkv` du repo sont bien en LFS avant chaque push.
